Abstract

The invention concerns a method for the subtypeindependent and/or species-independent detection of HI
viruses in a sample using at least one oligonucleotide
which contains at least 10 consecutive nucleotides from
(i) a highly conserved region of the LTR region, of the
gag gene or of the pol gene of HIV, (ii) a corresponding
region of another HI virus isolate, (iii) a
corresponding region of a consensus sequence derived
from several HI virus isolates or sequences which are
complementary thereto.
